cFosSpeed provides these services using a transparent method. It monitors bandwidth utilization of each PC in the network, updates information, and lets you know when the situation changes. In an office environment, this can have a big impact on LAN responsiveness. cFosSpeed was one of the first network management products that allow administrators to control network traffic from the web. Multifunction printers and devices [#Sec14] ----- Most multifunction devices (MFDs) are in the business office and provide a small footprint and high productivity. Often, they are connected to a network and can be an easy target for hackers. Common areas of concern are the network settings, such as the IP address, and the security features of the device. The Windows Management Instrumentation (WMI) Management Interface can be used to inspect the MFD properties and to read the connected networks. For an example, see Listing 3.4. **Listing 3.4** MFD WMI interface. 82157476af
